Week 1 Exercises

Jessica Riedy

2024-03-14

Please complete all exercises below WITHOUT using any libraries/packages.

Exercise 1

Assign 10 to the variable x. Assign 5 to the variable y. Assign 20 to the variable z.

```r
x <- 10
y <- 5
z <- 20
```

Exercise 2

Show that x is less than z but greater than y.

Note: your output must be a SINGLE boolean, do not output a boolean for each expression.

```r
x < z & x > y
```

```
## [1] TRUE
```

Exercise 3

Show that x and y do not equal z.

Note: your output must be a SINGLE boolean, do not output a boolean for each expression.

```r
x != z & y != z
```

```
## [1] TRUE
```

Exercise 4

Show that the formula `x + 2y = z`.

Note: your output must be a SINGLE boolean

```r
x + 2 * y == z
```

```
## [1] TRUE
```

Exercise 5

I have created a vector (test_vector) of integers for you. Determine if any of x, y, or z are in the vector.

Note: your output must be a SINGLE boolean, do not output a boolean for each expression.

```
test_vector <- c(1,5,11:22)
x %in% test_vector | y %in% test_vector | z %in% test_vector
```

```
## [1] TRUE
```

Exercise 6

Show which value is contained in the test vector. To do this you will need to create an element-wise logical vector using operators. `x == vector`. Once you have done that you will need to use slicing to return all indices that have matches. **Note: your output should be two integers**

```
xyz <- c(x, y, z)
for (i in 1:length(test_vector)) {
  if(test_vector[i] %in% xyz) {
    print(test_vector[i])
  }
}
```

```
## [1] 5
## [1] 20
```
